Winston Shin	35537142	y1c2b	winstonshin@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above. (In the case of Project Milestone 0, the main purpose of this page is for you to let us know your e-mail address, and then let us assign you to a TA for your project supervisor.)

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

Short Description

Our project is an app that allows its users to plan their meals and keep track of their nutritional intakes in detail over a set period of time. The users would initially input their budget, location, nutritional preferences, and time spent as a query. The app would help the user build a set meal schedule best accommodating their preferences, such as allowing the user to see each of their food choice's nutritional facts, which restaurant to order takeout from, which grocery store to buy certain ingredients, and provide recipes for making each food/meal that they plan to make themselves. It helps them keep track of their time and budget spent on dining and all related tasks. The frontend as it currently stands, shows a deconstructed version of this app: the developer's point of view. It depicts the different tables which would be queried to achieve all the functionalities listed prior. We currently show examples of different types of queries you could make on these tables.

SQL Script

Our sql script is found in the project directory under the filename "[initProjectTables.sql](#)"

Schemas in Database

We did a 3NF decomposition using a minimal cover and 3NF synthesis. Primary keys are underlined, while foreign keys are bolded.

- R1 (nutritionalReqID, nutritionalReqTotalSugars, nutritionalReqTotalFats, nutritionalReqTotalProteins, nutritionalReqTotalCalories)
- R2 (userid, uname, uaddress, budget, phone, **nutritionalReqID**)
- R3 (**userid**, mealPlanName, duration, date)
- R4 (mealName, diningTime, mealCuisine)
- R5 (foodName, foodCost, **nutritionalFactName**, discount, timeRequired)
- R6 (nutritionalFactName, nutritionalFactTotalProteins, nutritionalFactTotalSugars, nutritionalFactTotalFats, nutritionalFactsTotalCalories, **foodName**)
- R7 (recipeName, instructions, **foodName**)
- R8 (restaurantName, restaurantAddress, restaurantRating, restaurantCuisine)
- R9 (ingredientName, category)
- R10 (**ingredientName**, recipeName, quantity)
- R11 (groceryStoreName, groceryStoreAddress, openHours, groceryStoreRating)
- R12 (**groceryStoreName**, groceryStoreAddress, ingredientName, sellsCost)
- R14 (**userid**, mealName, mealPlanName, restaurantAddress, restaurantName, foodName)
- R15 (**userid**, mealName, mealPlanName, ingredientName, recipeName, groceryStoreName, groceryStoreAddress, foodName)

Schema Changes

- R13 was removed as it violated oracleDB syntax. We couldn't refer to partial primary keys as a foreign key (we needed to specify the whole primary key in the referencing table).
- "uid" was changed to "userid" as "uid" is already being used as a key in sql plus.
